TUMOUR REGISTRY

SIRIRAJ CANCER CENTER

This report of the tumour registry of the Siriraj Cancer Center for the year 1995 is the twenty-ninth annual report. Siriraj Cancer Center is previously the Cancer Institute Siriraj Hospital. This name has to be changed for several reasons. The data in this report is still the hospital based tumour registry. The terminology and classification are still using the WHO coding system.

The total number of new patients registered in this year is 3,741 or 1.56 percent of all new patients registered in the country. The most common diagnosis, confirmed histologically proved carcinoma, is colorectal cancer, which is 23.3 percent of the patients was diagnosed by clinical examination. Carcinoma of the uterine cervix is the most common carcinoma of the female genital tract, as found in other institutes. It is very interesting to note that the incidence of colorectal cancer becomes more higher in the last few years. The incidence of colorectal cancer is now the seventh rank of common cancers among males and females. This might be due to the change of eating habits.

According to the last meeting of the tumour registry committee from several departments in Siriraj Hospital, we finally agreed with the use of ICD-10 for collecting the data in various departments. This would make our data more confident and comparable with the international system.

I hope that this 1995 annual report would be useful to all.

INTRODUCTION

TABLE I
NUMBER OF PATIENT

This report of the tumour registry of the Siriraj Cancer Center for the year 1995 is the twenty-ninth annual report. Siriraj Cancer Center is previously the Cancer Institute Siriraj Hospital. This name has to be changed for several reasons. The data in this report is still the hospital based tumour registry. The terminology and classification has followed the WHO coding system.

The total number of new cancer patients in this year is 3,741 or 1.56 percent of all new patients at Siriraj Hospital. The diagnosis, confirmed histologically proved is 99.87 percent, whereas only 0.13 percent of the patients was diagnosed by clinical and X-rays evaluation. Carcinoma of the uterine cervix is the most common, 16.73 percent of all malignancies, as found in other institutes. It is very interesting to note that the incidence of colorectal cancer becomes more higher from the past recent years and now is the seventh rank of common cancers amongs Thai cancer patients. This might be due to the change of eating habits.

According to the last meeting of the tumour registry committee from several departments in Siriraj Hospital, we finally agreed with the use of ICD-10 for collecting the data in various departments. This would make our data more confident and would be simple for computer on-line system.

I hope that this 1995 statistical report would be useful to all.
